

KING CORNERS

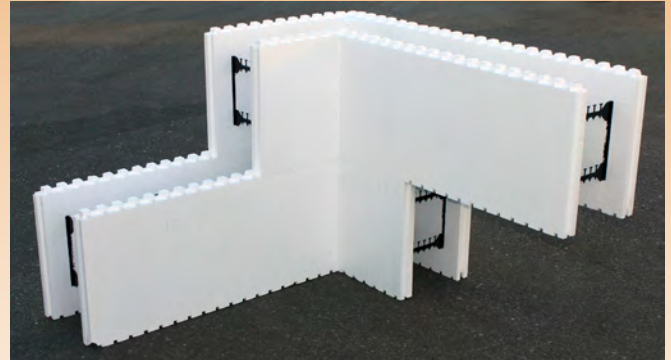

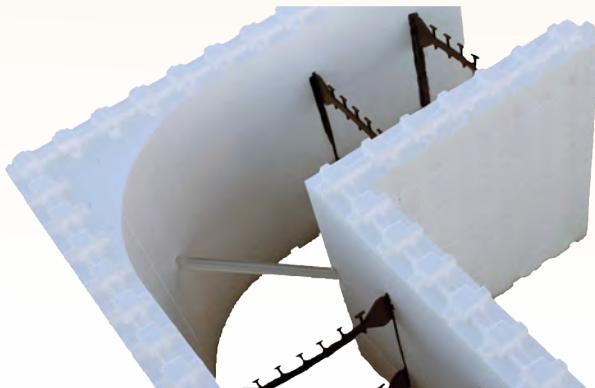

by Benchmark Foam

Versatile corner option for Benchmark ICFs

King Corners by Benchmark Foam are the one-piece corner option used with Benchmark Insulated Concrete Forms (ICF) building systems.

They have all the same properties of a Benchmark ICF block, including the tongue-and-groove interlock and embedded ties 6" on center. More benefits include:

- Available in right or left to accommodate all layouts.
- Added strength with an embedded corner tie made of more plastic to enhance durability.
- Versatile installation with option to install blocks staggered or on-bond.
- Save money and reduce installation confusion by eliminating the extra corner tie used with traditional molded corners.
- New design offers a wider nailing surface of 144 sq. in. with the embedded corner tie.

King Corners are 16" x 2' x 4' and have all the same properties of a Benchmark ICF block. While the traditional molded corners with separate corner ties will still be available, the King Corner option is designed to better accommodate every builder's needs.
